

IT Department Staff Structure

Purpose - To show how the IT team is organized for the campus network project and who reports to who

Structure:

Project Manager (Timothy): Leads the whole project, makes sure goals are met, assigns tasks and handles client communication.

Network Engineer (Vhutali): Designs the network layout, installs routers, switches, and wireless access points, and tests connections.

Systems Administrator (Yongama): Sets up servers, manages IP addresses, ensures data backup and monitors system performance.

IT Technician (Yongama): Assists with hardware setup, cabling, and troubleshooting issues.

Procurement Officer (Timothy): Gets quotes, handles purchasing and checks that all equipment meets project standards.

Trainer ((Vhutali): Trains staff on using the network and software tools

IT Security Policy Guidelines

Purpose - To make sure the campus network stays safe from cyber threats and data loss.

Guidelines

1. All users must have unique usernames and strong passwords that are changed every 100 days
2. Unauthorized access to network systems or equipment is not allowed
3. Devices must have updated antivirus and firewall protection
4. Important data should be backed up weekly to secure cloud or offline storage
5. Only IT staff can install new software or make network changes
6. Report any suspicious emails or files to the Systems Administrator (**Yongama**) right away
7. Wi-Fi access should be password-protected, and guest users must use a separate network
8. Confidential documents must not be shared outside the school network

Acceptable Use Polic

Purpose -To guide how staff and students use the network safely and responsibly.

Rules

1. The network is for schoolwork and learning purposes only

2. Users must not download illegal or harmful content
3. Personal devices can only connect if approved by the IT department
4. Do not share login details with anyone
5. Internet use may be monitored to ensure fair and safe usage
6. No changing system settings, deleting files or tampering with hardware
7. Respect others' privacy and follow all data protection laws
8. Breaking this policy may result in disciplinary action or loss of network access.

Approvals

Purpose- To make sure all IT equipment and software are properly requested and approved before purchase

- The IT team identifies what equipment or software is needed (routers, switches, cables)

- The **Procurement Officer** gets at least three quotations from trusted suppliers
- The **Project Manager** reviews the quotations and checks them against the project budget
- The **Campus Director** gives final approval for large purchases
- Once approved the Procurement Officer places the order and tracks delivery
- When items arrive, the Network Engineer checks that they match the order and are compatible
- All purchases are recorded in the asset register for tracking

Help Desk Procedures

Level 1 – Help Desk / IT Technician

Level 1 is the first point of contact for any IT problem The help desk or IT technician takes user reports by email, phone or in person and writes them in the support register

They try to fix simple problems like password resets, printer issues or Wi-Fi connection errors. If they can fix the issue they close the case. If not, they send it to Level 2 for more help.

Level 2 – Systems Administrator / Network Engineer

Level 2 handles the problems that Level 1 cannot fix. This includes network setup issues, server problems or configuration errors. The Systems Administrator or Network Engineer works on finding the cause of the problem and tests the system after fixing it. If they solve it, they close the case and inform the user. But if the problem is still not fixed, they send it to Level 3 for final support.

Level 3 – Project Manager / Specialist Support

Level 3 is the last level of support. The Project Manager or a specialist looks at the problem that could not be solved by Level 2; he may contact outside experts or suppliers if needed. They fix the issue, make sure everything works properly again, and update the support records. Once the user confirms the system is working, the case is closed.

Disaster Recovery

Purpose- To make sure the network can recover quickly from power loss, hardware failure or data damage.

Plan

1. **Data Backup-** All important files and configurations are backed up weekly to secure cloud storage.

2. **Redundancy-** Critical systems like servers and routers have spare units available
3. **Power Backup-** Use generators during load-shedding to protect devices
4. **Recovery Steps**
 - a. Identify what failed (server, router, power)
 - b. Notify the Systems Administrator and Project Manager
 - c. Restore backed-up data or replace the damaged hardware
 - d. Test all systems before going live again
5. **Documentation-** Every disaster event must be recorded with cause, solution, and time taken
6. **Review-** After each recovery, review what went wrong and improve the plan
